	<b>Page: 1 of 1</b>

## Overview

A web server is required to host ASP scripts provided by Mutare Software for its applications (e.g. EVM Plus, Message Mirror or ENS). These scripts allow users to modify their personal settings and administrators to modify global system settings via the Web.

## Requirements

Microsoft's Internet Information Service (IIS) is required to host the ASP scripts. IIS version 4.0 is required at a minimum.

If IIS 6.0 is used (Windows 2003 Server) or IIS 7.0 is used (Windows 2008 Server), the *Active Server Pages* and *Server Side Includes* web service extensions will be enabled for the website.

## Permissions/Connectivity

If the ASP scripts are to be installed on a separate web server, the web server must be granted permissions and have access to the database files located on the Application Server.
